## PROFESSIONAL SUMMARY

Software Engineer with 3.5+ years of experience designing, developing, testing and supporting enterprise financial trading software at ION Trading. Strong hands-on background in Java, Spring Boot, Hibernate, microservices, REST APIs, CI/CD, test automation, performance testing, application security and production troubleshooting. Delivered measurable outcomes: cut full regression from 3+ months to 4–6 hours, validated 200+ concurrent users, rolled out MFA to 11 clients with zero production rollbacks, and resolved a production security incident across 14 client deployments. Currently technical lead for four engineers on a back-office platform migration, writing code, reviewing code and owning design decisions.

## TECHNICAL SKILLS

**Languages:** Java, JavaScript (Node.js), Python, Groovy
**Backend & APIs:** Spring Boot, Hibernate, Microservices, REST APIs, WebSockets, Jackson, JSON, YAML, XML, Flask, Authentication and Authorization
**Engineering Practices:** Object-Oriented Design, Design Patterns (Adapter, Template Method), Asynchronous Programming, Code Reviews, Technical Design, Production Troubleshooting, JVM Memory Analysis, SDLC
**Testing & Performance:** Robot Framework, Selenium, Acceptance Testing, Test Automation, Performance Testing, Load Testing, Mock Services
**CI/CD & Observability:** Jenkins, Jenkins Job DSL, Nexus, Docker, Docker Swarm, Docker Compose, Prometheus, Grafana, Monitoring and Alerting
**Security & Identity:** Azure AD B2C Custom Policies, Microsoft Graph API, Multi-Factor Authentication (MFA), TOTP, Black Duck, Vulnerability Management, Incident Response, BIA, BCP, Disaster Recovery
**Domain & Delivery:** FX Trading, Post-Trade Settlement, Standing Settlement Instructions (SSI), Trade Affirmation, FIX Protocol Integration, Client Portals, Entitlements, Agile, Scrum, Sprint Planning, Release Coordination, Team Leadership, Technical Interviewing

## PROFESSIONAL EXPERIENCE

### Software Developer (Team Lead) | ION Trading India, Hyderabad | Jan 2023 – Present

#### Back-Office Migration & Client Stability | 2026 – Present

- Lead four engineers migrating an FX solution to a new back-office platform as technical lead: write production code, review the team's code and own design decisions, alongside sprint planning, estimation and retrospectives.
- Develop Java, Spring Boot and Hibernate 6.4 services for Standing Settlement Instructions (SSI) and FX settlement: restructured nested asynchronous callback chains into flatMap/map combinator pipelines for readable control flow and error handling, applied Adapter and Template Method patterns to reconcile conflicting SSI type hierarchies without duplicating logic, and refactored six-eyes approval and entitlement workflows.
- Built Robot Framework acceptance suites for SSI CRUD and client-portal trade affirmation using isolated, rerunnable scenarios.
- Own an alerting-framework upgrade in a key client's production environment and lead consolidation planning for business and technical monitoring; documented the solution's architecture and server topology.
- Investigated host memory pressure across ten Java services, traced it to JVM memory growth in a trade-approval service, and quantified over-commitment risk.
- Interviewed 8+ candidates for Software Developer roles (ongoing); conduct performance reviews and introduced a knowledge-transfer rotation to reduce single-person dependency in production issue analysis.

#### Security, Identity & Resilience | 2024 – Jan 2026

- Owned end-to-end MFA delivery for ION's TradAir FX platform on Azure AD B2C custom policies; first product at ION to complete MFA and move every client onto it, with the approach reused by other teams.
- Rolled MFA out to 11 clients and tens of thousands of users with zero production rollbacks: stood up parallel instances of the multi-tenant service instead of upgrading the shared one, and gated MFA per client through configuration, so any client could be rolled back independently; released through staging, UAT and production.
- Resolved a multi-account user constraint that blocked the programme by documenting options, securing stakeholder sign-off, relaxing role constraints and extending an on-behalf-of sales feature with trade-permission controls.
- Built a Node.js and Microsoft Graph API utility to migrate users into Azure, still used for record maintenance; provisioned S3-hosted login templates and planned and coordinated an AWS WAF migration with the cloud team.
- As product Technical Information Security Officer (TISO), owned the product's security posture and brought exploitable critical vulnerabilities to zero.
- Led the application-side response to a production security incident: reproduced the exploit, identified the multipart request-handling root cause, and delivered a fix plus runtime upgrade across all 14 client deployments over a weekend.
- Created vulnerability remediation workflows with SLAs and an FX-wide vulnerability dashboard, adopted across FX and other divisions; contributed to business impact analysis, business continuity and disaster-recovery testing.

**Platform Engineering & Quality | 2023 – 2024**

- Built CI/CD for a newly acquired FX trading platform on Jenkins and Nexus: defined every job as code with Jenkins Job DSL and Groovy templates so the entire CI can be rebuilt if Jenkins is lost, migrated build jobs into ION's network, and containerised remaining services with Docker.
- Designed the acceptance-testing strategy for a WebSocket-based trading application and built Selenium/Robot Framework keyword libraries and mocked FX markets; the framework grew to ~900 automated tests, cutting full regression from 3+ months of manual testing to 4–6 hours.
- Built a distributed load-testing framework: drove real user flows through Selenium because the WebSocket-coupled UI could not be load-tested at the API, and moved to Docker Swarm across spot instances after a single machine failed at ~50 simulated users; instrumented services with Prometheus and Grafana behind a one-click Jenkins job, validated 200+ concurrent users against the contractual target, and isolated a WebSocket bottleneck in the Node.js tier, prototyping horizontal scaling as the fix.
- Delivered GUI and core development for a tight-deadline client integration, embedding the trading GUI in a client portal and integrating with a legacy back office over FIX; designed the user-model workaround now in production and became the integration subject-matter expert.
- Clarified requirements with Product, coordinated releases, introduced a standard release-request process, and prepared handover documentation for Customer Support.

**Technical Head | Kite India (startup) | Mar 2022 – Dec 2022**

- Led development of a travel-package publishing platform; rebuilt the backend in Flask and delivered payment integration.

**Cloud & Backend Developer | Papersdrop (VIT-incubated startup) | Jul 2021 – Jan 2022**

- Built REST APIs for a ReactJS frontend, implemented endpoint authentication, designed database schemas, and set up CI/CD from staging to production on Heroku.

## EDUCATION

- **B.Tech, Computer Science and Engineering (Business Systems)** | Vellore Institute of Technology (VIT), Vellore | 2019 – 2023 | CGPA: 9.41/10; ranked 3rd in batch
- **AISSCE (Class XII), Computer Science** | Devagiri CMI Public School, Kozhikode | 2019 | 97%

## AWARDS, LEADERSHIP & CERTIFICATION

- First place, ION internal hackathon (2023)
- First place, PrepBytes-O-Mega Fest Hackathon (2020): CELIS, a personalised cross-platform course recommender
- Presented "Product Development" to 250+ graduate hires and executive leadership at ION's global induction (2026)
- General Secretary, Soft Computing Research Society, VIT (2021 – 2022)
- Microsoft Certified: Azure AI Fundamentals
